2.1 Use Modules

1. When modules switch on or off, after accessing positive supply power with 5 ± 0.5 voltage, then input signal levels, if signal levels input before supply power becomes stable or switches off, IC circuits off, modules will be damaged, as a result, modules will be damaged.
2. Dot matrix modules are high path-number LCDs, they are largely related to the contrast, view angle, driving voltage when displaying, so you should adjust it to get best contrast and view angle, if it is too high, not only displays are effected, but also let life shorted.
3. When using under regulated working temperature below, the display responsiveness is too slow, when using under regulated temperature above, whole display surface turns dark, this is not damaged, when the temperature returns normal, all displays become normal

2.2. Module storage

1. Storing temperature: $-30\sim +80^{\circ}\text{C}$
2. Place in dark sites to avoid strong lights
3. Don't place other thing on their surfaces
4. Packaged in polyer materials (with anti-static electricity layers) and sealed

2.3. Soldering

1. Iron head temperature: $280\pm 10^{\circ}\text{C}$
2. Soldering time: $< 3-4\text{S}$
3. Soldering material: eutectic nature, low melting point
4. Don't use acid solder
5. Soldering don't repeat above 3 times

3. Mechanical Specifications

Item	Value	Unit
Number of dots	128 X 64	Dot
Dot size	0.42 X 0.58	MM
Dot pitch	0.44 X 0.6	MM

Response time(rise)	ton	$\theta = 5^\circ, \varnothing = 0^\circ$	-	170ms	260ms	Note 4
Response time(fall)	toff	$\theta = 5^\circ, \varnothing = 0^\circ$	-	250ms	380ms	Note 4

Note 1: Definition of angles θ and \varnothing

Note 2: Definition of viewing angles θ_1 and θ_2

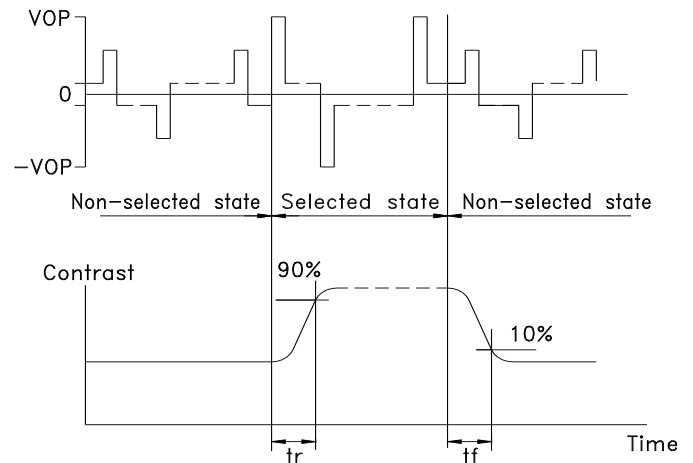

Note : Optimum viewing angle with the naked eye and viewing angle θ at C_{max} . Above are not always the same

Note 3: Definition of contrast C

$$C = \frac{\text{Brightness (reflection) of unselected dot (B2)}}{\text{Brightness (reflection) of selected dot (B1)}}$$

Note 4: Definition of response time

Note: Measured with a transmissive LCD panel which is displayed 1 cm^2

V_{OPR} : Operating voltage
 t_{ON} : Response time (rise)

f_{FRM} : Frame frequency
 t_{OFF} : Response time (fall)

10. Display Command

COMMANDS Summary

Instructions	Code										Functions	
	R/W	D/I	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0		
Display on/off	0	0	0	0	1	1	1	1	1	1/0	Controls display on/off. RAM data and internal status are not affected.	
Display start line	0	0	1	1	Display start line (0-63)					Specifies the RAM line displayed at the top of the screen.		
Set Page (x address)	0	0	1	0	1	1	1	Page (0-7)			Sets the page (X address) of RAM at the page (X address) register.	
Set Y address	0	0	0	1	Y address (0-63)					Sets the Y address in the Y address in the counter.		
Status read	1	0	Busy	0	ON/OFF	Reset	0	0	0	0	<p>Reads the status.</p> <p>Reads 1: Reset 0: Normal</p> <p>ON/OFF 1: Display off 0: Display on</p> <p>Busy 1: Internal operation 0: Ready</p>	
Write display data	0	1	Write data								Writes data DB0 (LSB) to DB7 (MSB) on the data bus into display RAM.	Has access to the address of the display RAM specified in advance. After the access, Y address is increased by 1.
Read display data	1	1	Read data								Reads data DB0 (LSB) to DB7 (MSB) from the display RAM to the data bus.	

Display On/Off

	R/W	D/I	DB7						DB0
Code	0	0	0	0	1	1	1	1	1	D
	MSB					LSB				

The display data appears when D is 1 and disappears when D is 0. Though the data is not on the screen with D=0, it remains in the display data RAM. Therefore, you can make it appear by changing D=0 into D=1.

Display Start Line

	R/W	D/I	DB7						DB0
Code	0	0	1	1	A	A	A	A	A	A
	MSB					LSB				

Z address AAAAAA (binary) of the display data RAM is set in the display start line register and displayed at the top of the screen. Figure 1 shows examples of display (1/64 duty cycle) when the start line=0-3. When the display duty cycle is 1/64 or more (ex. 1/32, 1/24 etc.), the data of total line number of LCD screen, from the line specified by display start line instruction, is displayed.

See figure 1.

Set page (X address)

	R/W	D/I	DB7						DB0
Code	0	0	1	0	1	1	1	A	A	A
	MSB					LSB				

X address AAA (binary) of the display data RAM is set in the X address register. After that, writing or reading to or from MPU is executed in this specified page until the next page is set. See figure 2.

Set Y Address

	R/W	D/I	DB7						DB0
Code	0	0	0	1	A	A	A	A	A	A
	MSB					LSB				

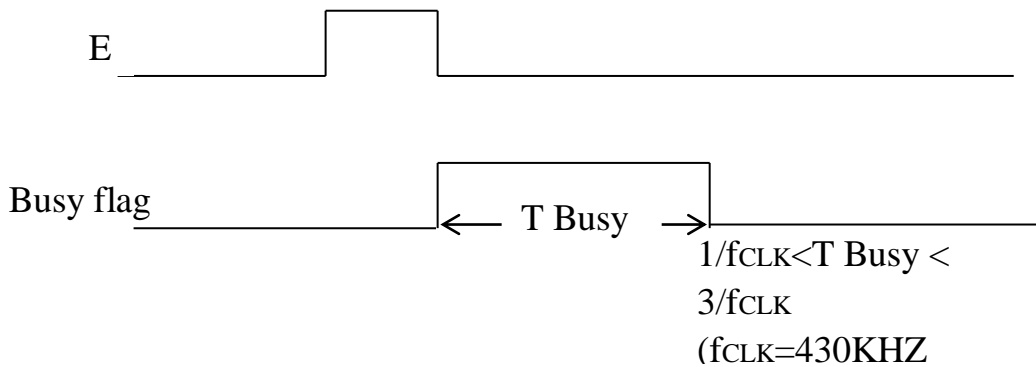

Y address AAAAAA (binary) of the display data RAM is set in the Y address Counter. After that, Y address counter is increased by 1 every time the data is written or read to or from MPU.

Status Read

	R/W	D/I	DB7.....DB0								
Code	1	0	BUSY	0	ON/OFF	REST	0	0	0	0	
	MSB										LS

- Busy

When busy is 1, the LSI is executing internal operations. No instructions are accepted while busy is 1, so you should make sure that busy is 0 before writing the next instruction.

- ON/OFF

Shows the liquid crystal display conditions: on condition or off condition.

When on/off is 1, the display is in off condition.

When on/off is 0, the display is in on condition.

- RESET

RESET=1 shows that the system is being initialized. In this condition, no instructions except status read can be accepted.

RESET=0 shows that initializing has finished and the system is in the usual operation condition.

Write Display Data

	R/W	D/I	DB7.....DB0								
Code	0	1	D	D	D	D	D	D	D		
	MSB										LSB

Write 8-bit data DDDDDDDD (binary) into the display data RAM. Then Y address is increased by 1 automatically.

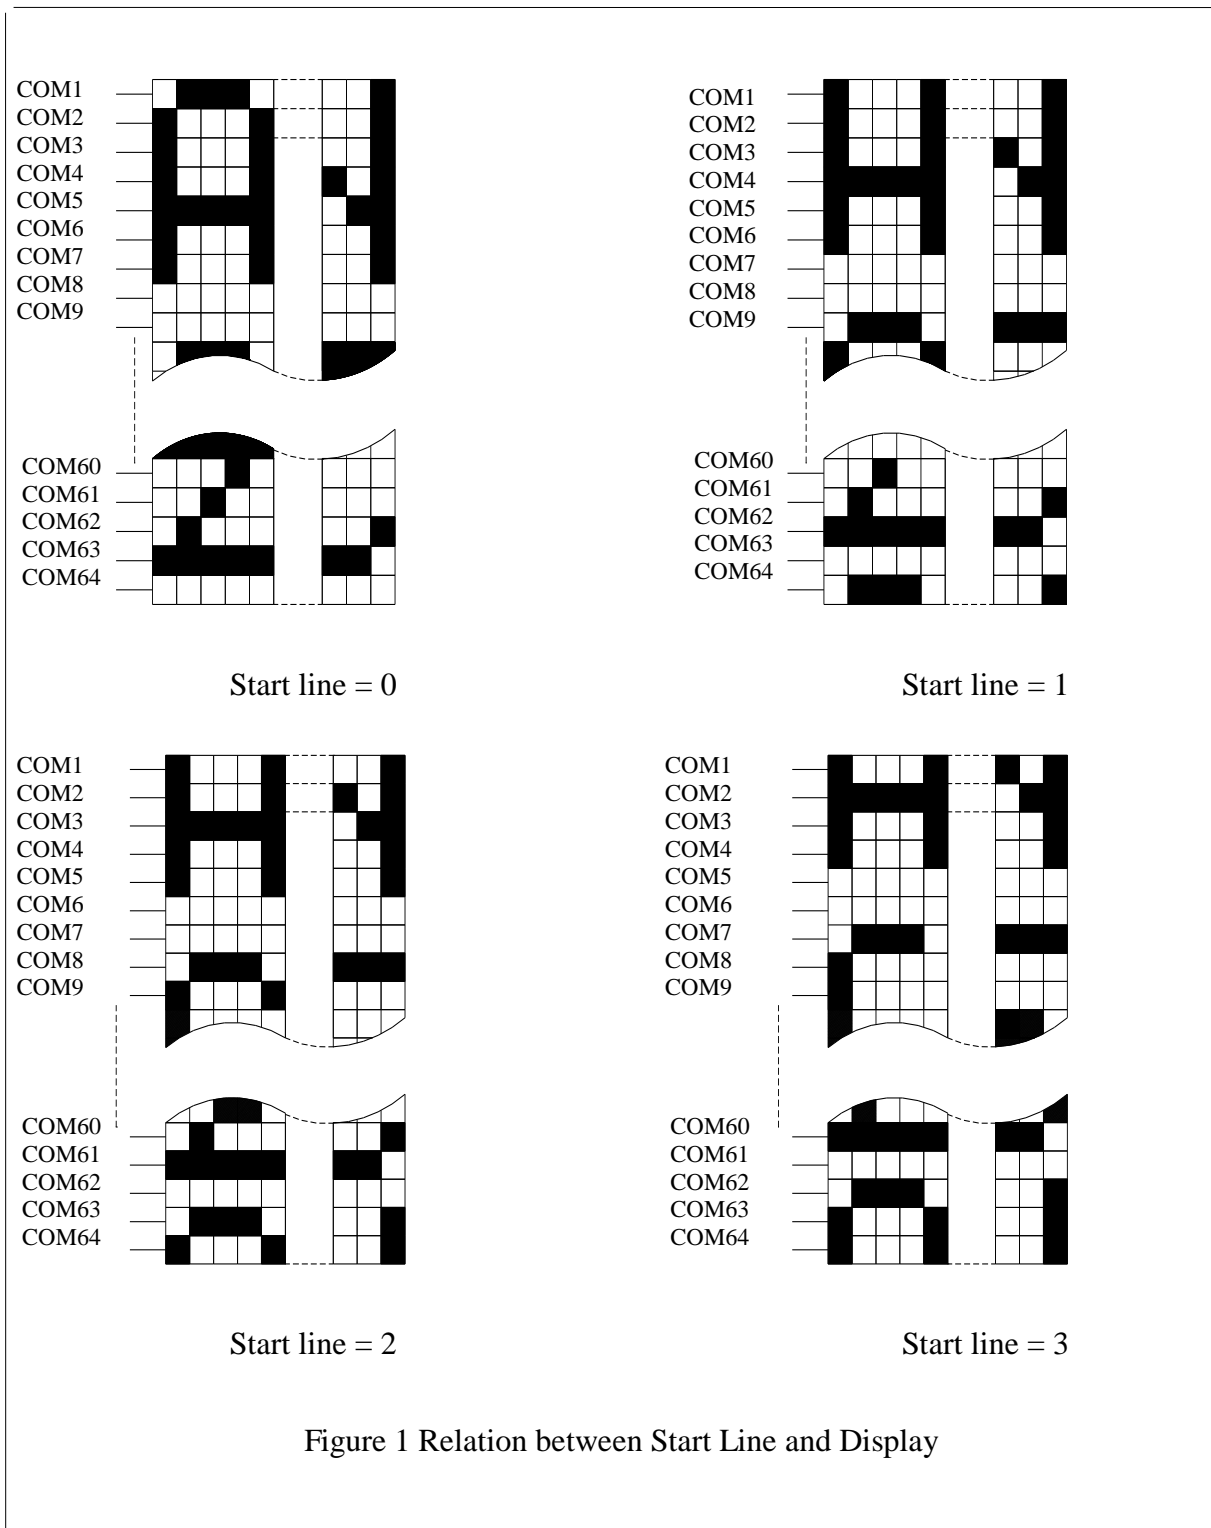

Read Display Data

Reads out 8-bit data DDDDDDDD (binary) from the display data RAM. Then Y address is increased by 1 automatically.

One dummy read is necessary right after the address setting. For details, refer to the explanation of output register in “Function of Each Block”.
